

MODELS -

In my project, I used the Recipe model to represent various recipes, including attributes like name, ingredients, cooking_time, description, difficulty, and pic for storing the recipe's image. This structure allows for a comprehensive description of each recipe and its requirements. I am not changing any attributes as the current model effectively captures all necessary details for each recipe.

“frontend inspirations”

- <https://www.allrecipes.com/> - I like this home page since it has everything you need.
- <https://damndelicious.net/> - This one is my favorite one, it's not so busy but it has what is needed and nothing more, it's simple to navigate and it doesn't feel overwhelming.
- <https://www.halfbakedharvest.com/> - Good page with good images but they're wasting space at the top of the home page is just blank
